**Agile** is an iterative approach to project management and software development. Due to many advantages, it is very popular when implementing medium and big projects. However, without any additional tools, it quickly becomes hard to manage. Luckily for us, there exist tools on the market that can help with that.

Trello

Asana

Jira

Clickup

But none of them provide all features useful in **Agile**. Some of them must be additionally bought.

**GitHub** is a popular place to host repositories. It is used both in open-source and closed-source commercial programs. Wouldn't it be nice if our Agile platform could be fully synchronized with our repository?

**ScrumHub** is a platform supporting **Agile** development fully integrated with your **GitHub** repository. For both developers and project managers.

Supported features: connecting to the **Repository**, creating, estimating, and prioritizing **Product Backlog** items, dividing them into **Sprints**, adding Tasks, assigning them to people, creating branches, automatical task progress based on pull requests.
